

DOT SYSTEM

The DOT System is a series of fire gear decon bags and accessories designed to encapsulate contaminated gear after a fire to minimize exposure to harmful contaminants. It is a "Healthy Firefighters" approved product and a part of an overall recommended protocol to protect firefighters from occupational cancer and other illnesses.

The components are highly durable polyester reinforced polyvinyl chloride and are designed to be re-used for years. They can be easily cleaned in an extractor or washing machine and hung to dry quickly, minimizing environmental impact.

Approved by
