# Events History

Comprehensive Records Management for Emergency Communications

What is Events History?

Events History is a comprehensive cloud-native records-management solution that captures ongoing and recent calls including location, video, imagery, call transcripts, and more.

Comprehensive Records Management

Capture timestamps, phone numbers, station ID, device type, call duration, call audio, call transcripts, location history, video footage, instant messaging transcripts, questionnaires executed, third-party intelligence data, call termination reason, and more.

Elastic Records Storage

As a cloud-native solution, Events History can scale as your records storage needs grow, so you never have to worry about technology failing to keep up with your business needs.

Tabulate Data or Visualize on a Map

Retrieve your records in tabular format or interactively on a map, including street view and satellite view. Use a heat map to identify cluster groups within your records.

Search and Filter to find your Data Faster

Find your needles in your haystack quicker using Events History search and filter capabilities to query by event ID, phone number, station ID, date, duration, and more.

Extract Data for Custom Analysis

Having found and visualized your records, you can then extract them either individually or collectively for further analysis using your existing systems.

"Public safety leadership needs valid data now, more than ever. Carbyne provides real time information for situational awareness that keeps the public safe. It is a vital tool."

Ed Davis
Former Boston Police Commissioner
